

AI Resume Analysis Report

Resume: resume_chandra_shekhar_kumar (2).pdf

Here is an expert analysis of your resume, along with constructive feedback and actionable suggestions to help you secure an internship.

1. Resume Score: 48/100

* **Category:** Entry-Level / Student Resume.

* **Verdict:** Your resume is clean and has a logical structure, but it currently lacks the technical depth, project variety, and attention to detail required to stand out in the highly competitive AI/ML field. Fixing critical typos and expanding your project portfolio will significantly boost this score.

2. Strengths

* **Clear Objective:** Your professional summary clearly states who you are (a B.Tech CSE student) and what you want (an internship).

* **Relevant Education:** Pursuing a B.Tech in Computer Science and Engineering from DAV University is highly relevant and aligns with your career goals.

* **Core Python Foundation:** Showcasing Python, Pandas, and Matplotlib indicates you have started building the necessary foundation for data science.

3. Weaknesses & Critical Errors

* **Spelling & Formatting Errors (High Priority):**

* Under Skills, there is a major typo: `"Techinacl SkillsArtificial Intelligence"`. It should be formatted cleanly as `"Technical Skills"` with a space/colon before the skills list.

* **Inconsistent/Future Dates (High Priority):**

* Your project and certification dates are listed as `"Jun '25 — Jul '25"` and `"Jul '25"`. If these are future dates (or placeholders from a template), it looks highly unprofessional and confusing to a recruiter. Ensure all dates reflect the actual timeline (e.g., `"Jun '24 - Jul '24"`).

* **Lack of ML/AI Depth:**

* While you list "Artificial Intelligence" and "Machine Learning" as skills, your single project only showcases basic `Data Analysis` (Pandas/Matplotlib). You haven't listed or demonstrated experience with actual ML algorithms (e.g., Linear Regression, Decision Trees) or ML libraries (e.g., Scikit-Learn).

* **Only One Project:**

* A single project is not enough to convince recruiters of your practical capabilities. You need at least `2 to 3 robust projects` to build credibility.

* **Weak Bullet Points:**

* Using phrases like `"Learned data cleaning..."` is weak. Resumes should focus on what you `did` and `achieved`, not just what you learned. Use active verbs (e.g., `"Cleaned and preprocessed"`

unstructured data..."*).

* **Outdated High School References:**

* Listing "Class Monitor" from high school (2019–2021) is outdated for a university-level engineering resume. Replace this with college-level club activities, hackathons, or technical societies.

4. Missing Skills (Essential for AI/ML & Data Analysis)

To be competitive for AI/ML or Data Analyst internships, you must add and learn the following skills:

* **Data Manipulation & Math:** NumPy, SciPy, Linear Algebra, Statistics & Probability.

* **Machine Learning Libraries:** Scikit-Learn (essential for beginner ML).

* **Data Visualization:** Seaborn (modern alternative to Matplotlib).

* **Databases:** SQL (highly critical; almost every data role requires SQL to query databases).

* **Version Control:** Git & GitHub (crucial for sharing your project code with recruiters).

* **Deep Learning (Optional/Advanced):** TensorFlow or PyTorch.

5. Career & Resume Improvement Suggestions

Step 1: Fix the Project Section

* **Add 1–2 more projects.** For example:

* **Project 2 (Machine Learning):** A predictive model (e.g., House Price Prediction using Scikit-Learn's Linear Regression).

* **Project 3 (SQL + Visualization):** An interactive dashboard using Power BI/Tableau or a SQL-based data analysis project.

* **Rewrite your project bullet points** using the **X-Y-Z formula** (Accomplished [X] as measured by [Y], by doing [Z]).

* **Instead of:** "Used Pandas and Matplotlib for data processing and visualization."

* **Write:** "Processed and cleaned a dataset of 50,000+ crime records using **Pandas**, reducing data noise by 15%, and generated **Matplotlib** visualizations to identify high-risk urban zones."

Step 2: Update Your Skills Section

Divide your skills logically to make them readable:

* **Programming Languages:** Python, SQL

* **Data Analysis & Visualization:** Pandas, NumPy, Matplotlib, Seaborn

* **Machine Learning:** Scikit-Learn, Supervised Learning (Regression, Classification)

* **Developer Tools:** VS Code, Jupyter Notebook, Git/GitHub

Step 3: Remove Grade 10 details if space is needed

As a B.Tech student, your 10th-grade details and school-level volunteering are less relevant. Use that space to expand your college projects and technical skills.

6. Interview Preparation Tips (For Internships)

Since you are targeting internships, interviewers will focus on your fundamentals. Prepare for the following:

1. **Python Coding Fundamentals:**

- * Be ready to code basic algorithms. Understand Python data structures (lists, dictionaries, sets, tuples), list comprehensions, and basic OOP (Classes and Objects).

2. **Pandas & Data Manipulation:**

- * Expect live coding or syntax questions. Practice how to handle missing/null values, group data (groupby), merge/join dataframes, and filter rows.

3. **Basic SQL Questions:**

- * Learn basic SQL queries. Practice `SELECT`, `WHERE`, `GROUP BY`, `ORDER BY`, and standard database `JOINS` (Inner, Left, Right).

4. **Project Walkthrough (The "Star" Method):**

- * Be prepared to explain your "Crime Data Analysis" project. What was the goal? What problems did you find in the data (e.g., missing values, duplicates)? What insights did you find?

5. **Basic ML Concepts:**

- * Know the difference between Supervised and Unsupervised learning.

- * Understand basic algorithms: Linear Regression (for predicting numbers) vs. Logistic Regression (for classification).
